	ı	

## <u>ABSTRACT</u>

2	The instant invention involves the use of a
3	combination of preparatory steps in conjunction with mass
4	spectroscopy and time-of-flight detection procedures to
5	maximize the diversity of biopolymers which are verifiable
6	within a particular sample. The cohort of biopolymers
7	verified within such a sample is then viewed with
8	reference to their ability to evidence at least one
9	particular disease state; thereby enabling a diagnostician
19 110 111 112	to gain the ability to characterize either the presence or
111	absence of said at least one disease state relative to
12	recognition of the presence and/or the absence of said
13	biopolymer, predict disease risk assessment, and develop
114	therapeutic avenues against said disease.
